

Climate Change Beliefs and Adaptation Plans in Bangladesh

Gharad Bryan, Robin Burgess, Stefano Caria, Jack Thiemel

May 10, 2024

- Changes in technology, location and occupation can substantially reduce the damages of climate change (Cruz Rossi Hansberg 2021).
- Are individuals informed about future shocks so that they can action these changes before disaster strikes?

Experiment design

We elicit beliefs about future climate change among a sample of 5,700 individuals in rural Bangladesh.

We provide $0.5^{\circ} \times 0.5^{\circ}$ scientific forecasts on:

1. Future climate change
2. The damage function
3. Future climate change + the damage function

We study impacts on climate beliefs and expected adaptation investments (both in situ and through location and occupation change).

Roadmap

Design

Results

- Are people worried? Does this matter?
- What do people know about shocks and damages?
- What are the impacts of information provision?

Discussion

The sample

We interview a sample of 5,700 households living in rural Bangladesh.

- We select high and low impact villages from a representative survey collected by BRAC.
- We randomly sample households in these villages.
- We interview head of the household, and ask some questions to the partner, if present.

Four key decisions

1. What scenario to present? *SSP2/RCP4.5 (using CMIP5 and CIMP6 data from Byers et al. 2018; extreme heat data as in Carleton et al. 2022)*
2. What time frame to use? *2050*
3. Which information to provide/beliefs to elicit?
 - Extreme heat, floods, yields, mortality, sea level rise, total economic impacts [▶ Link](#)
 - *Changes*
 - *Damages*
 - *Impacts*
4. Which outcomes to measure? *Climate beliefs, expected adaptation investments, incentivised policy demand.*

Experiment design

We provide *local* forecasts on:

1. Future climate change
2. Damage function
3. Future climate change + damage function
4. (3) + information about Dhaka
5. (3) - information about worst-case scenario

► Balance

Roadmap

Design

Results

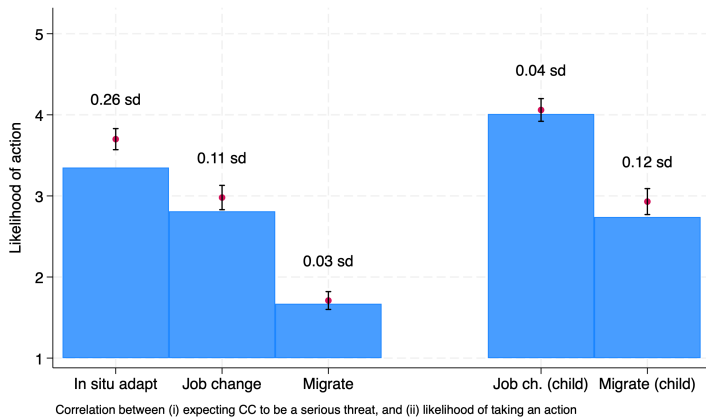

- Are people worried? Does this matter?
- What do people know about shocks and damages?
- What are the impacts of information provision?

Discussion

Widespread concern with climate change

Concerns predict likely actions

Roadmap

Design

Results

- Are people worried? Does this matter?
- **What do people know about shocks and damages?**
- What are the impacts of information provision?

Discussion

0. Quantitative beliefs data has reasonable quality

Quantitative beliefs correlate with:

- qualitative beliefs [▶ Link](#)
- climate change worries [▶ Link](#)

Quantitative beliefs are internally consistent:

- People who expect largest falls in yields also expect highest returns to adaptation [▶ Link](#)
- People who expect highest returns to adaptation more likely to expect to invest in adaptation [▶ Link](#)

1. Wide dispersion of beliefs on future changes and damages

Belief dispersion: extremely hot days

Belief dispersion: yield damage function

► Total yield change

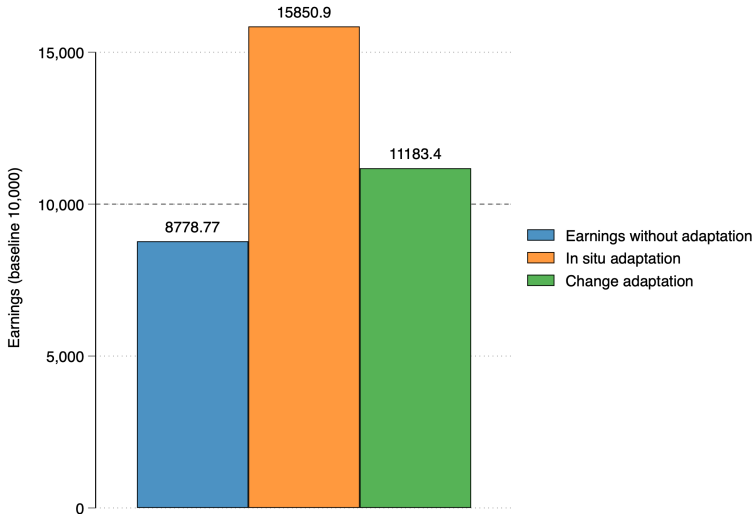

Insignificant correlation with scientific forecasts

Does Reality Predict Beliefs?

Yields in 2050

2. Respondents expect future income growth, given adaptation

▶ Returns in situ

▶ Returns change

Roadmap

Design

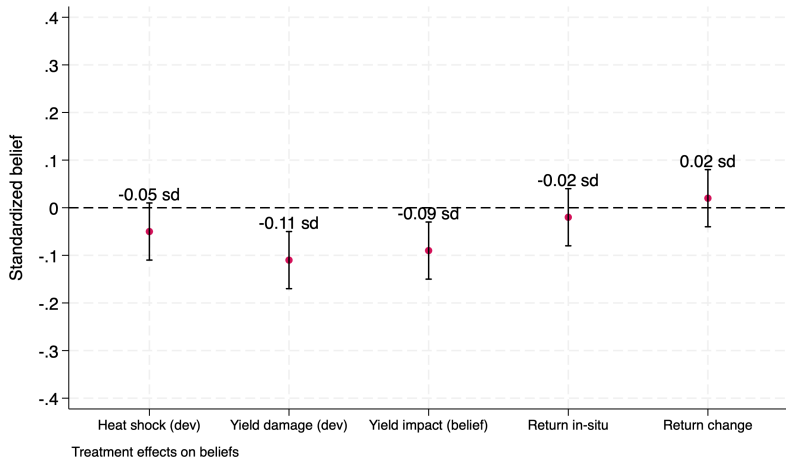

Results

- Are people worried? Does this matter?
- What do people know about shocks and damages?
- **What are the impacts of information provision?**

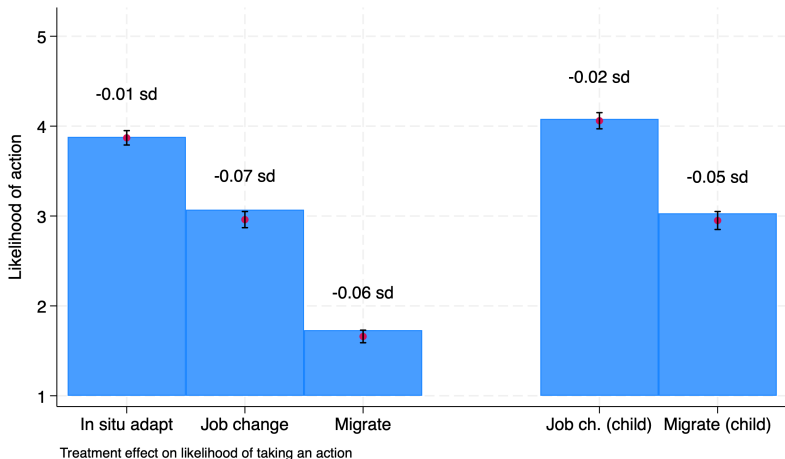

Discussion

1. Average treatment effects

Fewer mistakes, larger expected negative impacts, no changes in returns to actions

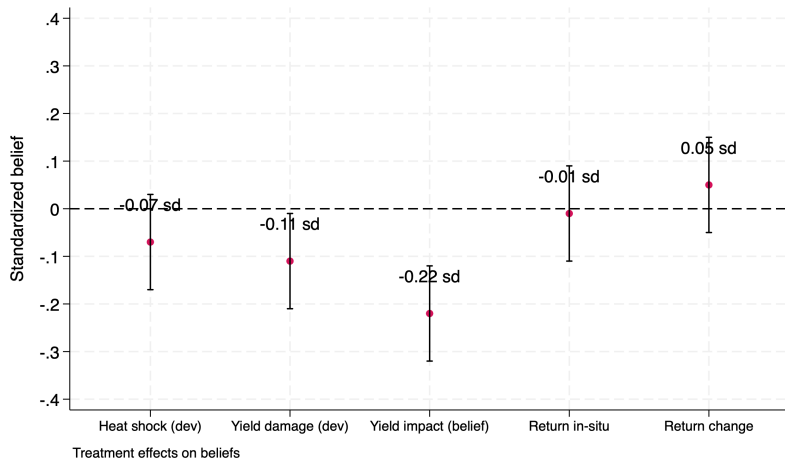

If anything, treatment lowers willingness to adapt

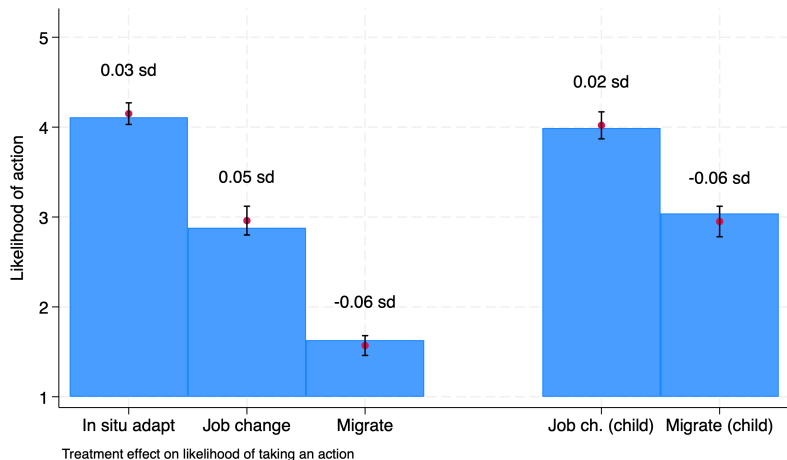

2. Treatment effects for people engaged in agriculture

Larger effects on impact beliefs

No changes in willingness to adapt

▶ No agriculture

Roadmap

Design

Results

- Are people worried? Does this matter?
- What do people know about shocks and damages?
- What are the impacts of information provision?

Discussion

1. Mental model of climate change: impacts will be bad, but in-situ adaptation can secure further income growth.
 2. Beliefs about specific climate shocks and damages differ widely across people, and deviate from scientific forecasts.
 3. Providing information on shocks and damages does not meaningfully affect adaptation plans (in the short-run).
- Should we provide information about returns to different adaptation strategies?

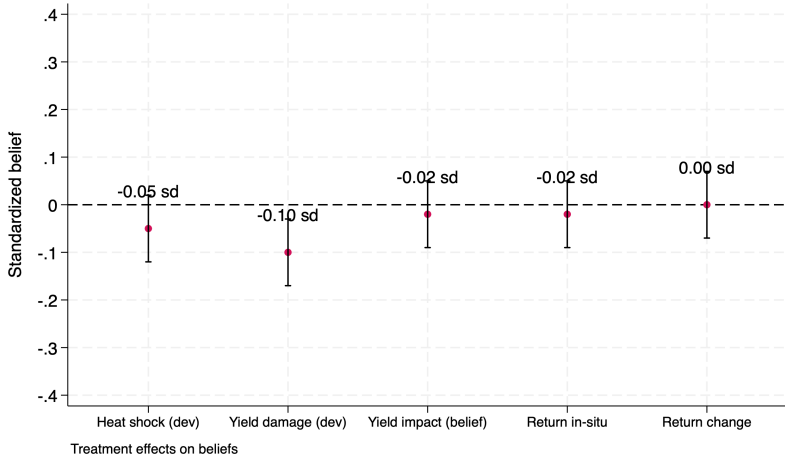

1. Mental model of climate change: impacts will be bad, but in-situ adaptation can secure further income growth.
 2. Beliefs about specific climate shocks and damages differ widely across people, and deviate from scientific forecasts.
 3. Providing information on shocks and damages does not meaningfully affect adaptation plans (in the short-run).
- Should we provide information about returns to different adaptation strategies?

Thank you!
